

Q1 A shopkeeper wants to display the total number of items and total bill on the receipt. Declare two `int` variables `items = 12` and `totalBill = 850`, then print them with proper labels using `cout`.

Q2 A weather display board shows the current temperature. Declare a `float` variable `temperature = 28.5` and display it with the message "Current Temperature: 28.5 C".

Q3 A result card shows a student's grade. Declare a `char` variable `grade = 'A'` and display it as "Your Grade: A".

Q4 A university admission form asks for the applicant's age. Take an integer input from the user using `cin` and store it in a variable `age`, then display it back as "Your age is: [age]".

Q5 A petrol station's billing system asks the attendant to enter today's fuel price per liter. Take a `float` input `pricePerLiter` and display it.

Q6 A hospital registration form asks for the patient's blood group symbol (e.g., A, B, O). Take a single `char` input and display: "Patient Blood Group: [char]".

Q7 A real estate agent needs the area of a plot. Formula: $\text{Area} = \text{Length} \times \text{Width}$. Take `length` and `width` as `int` inputs from the user and display the calculated area.

Q8 A power company calculates a customer's bill. Formula: $\text{Bill} = \text{UnitsConsumed} \times \text{RatePerUnit}$. Take `unitsConsumed` (`float`) and `ratePerUnit` (`float`) as input and display the total bill.

Q9 A bank calculates simple interest on a loan. Formula: $\text{SI} = (\text{Principal} \times \text{Rate} \times \text{Time}) / 100$. Take `principal`, `rate`, and `time` as `float` inputs and display the interest.

Q10 A teacher wants to quickly note a student's performance category using one letter: 'E' for Excellent, 'G' for Good, 'P' for Poor. Declare a `char` variable, assign one of these values, and display a message combining it with the student's name (a separate variable).

Q11 A ride-hailing app estimates fare. Formula: $\text{Fare} = \text{BaseFare} + (\text{Distance} \times \text{RatePerKm})$, where `BaseFare` is a fixed `int` (e.g., 50) and `Distance/RatePerKm` are `float`. Take `distance` as input and display the estimated fare.

Q12 A fitness app calculates BMI. Formula: $\text{BMI} = \text{Weight}(\text{kg}) / (\text{Height}(\text{m}) \times \text{Height}(\text{m}))$. Take `weight` and `height` as `float` inputs from the user and display the BMI.

Q13 An online store shows price with a currency symbol. Declare a `char` variable `currencySymbol = '$'` and an `int` variable `price = 1500`, then display them together as "\$1500" in one line.

Q14 A results system calculates percentage. Formula: $\text{Percentage} = (\text{ObtainedMarks} / \text{TotalMarks}) \times 100$. Take `obtainedMarks` and `totalMarks` as `int` inputs, and display the percentage (cast to `float` before dividing so the result isn't truncated to a whole number).

Q15 A restaurant's order slip shows: table number (`int`), total bill (`float`), and payment method as a single letter - 'C' for Cash, 'K' for Card (`char`). Take all three as input from the user and display a formatted order summary using all three data types in one `cout` statement.
